Quality_R

WCui

9/26/2020

Object: Build a predictive model to forecast the wine quality.

1. Data preprocessing

First, we will have a peek at the dataset.

```
redwine = read.csv("winequality_red.csv")
redwine$good.wine = ifelse(redwine$quality > 6, 1, 0)
str(redwine)
```

```
## 'data.frame':    1599 obs. of  13 variables:

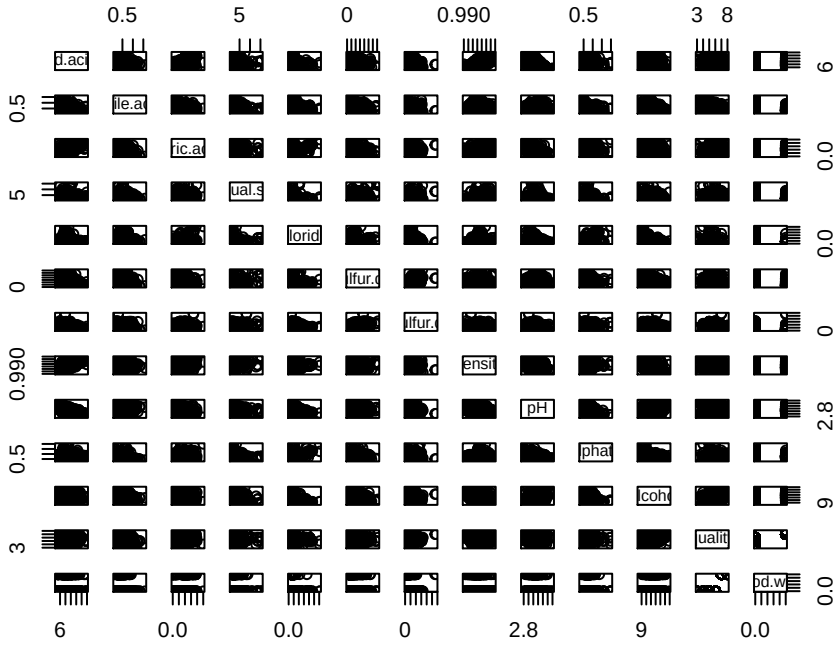
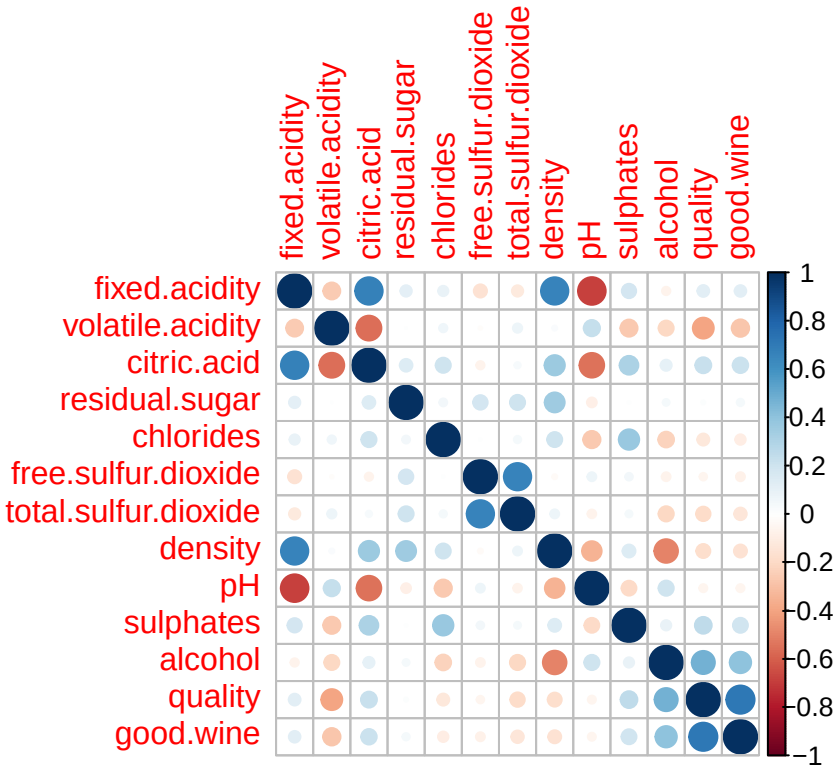
2. Data Visulization (ggplot)

Next, we will explore the correlation among the variables.

```
plot(redwine)
```

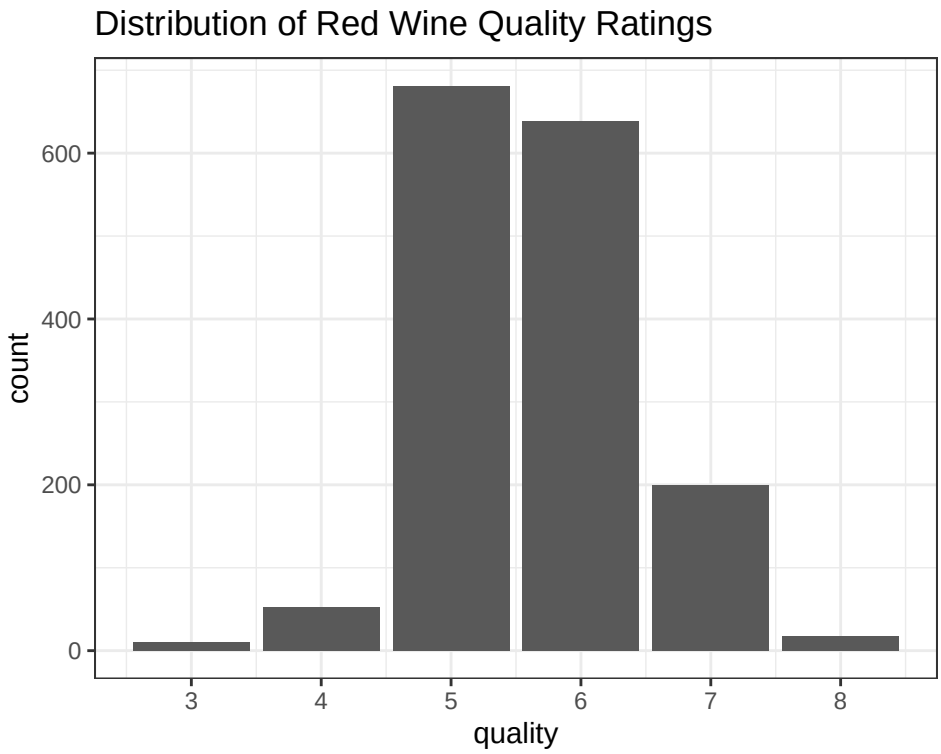


```
corrplot(cor(redwine))
```

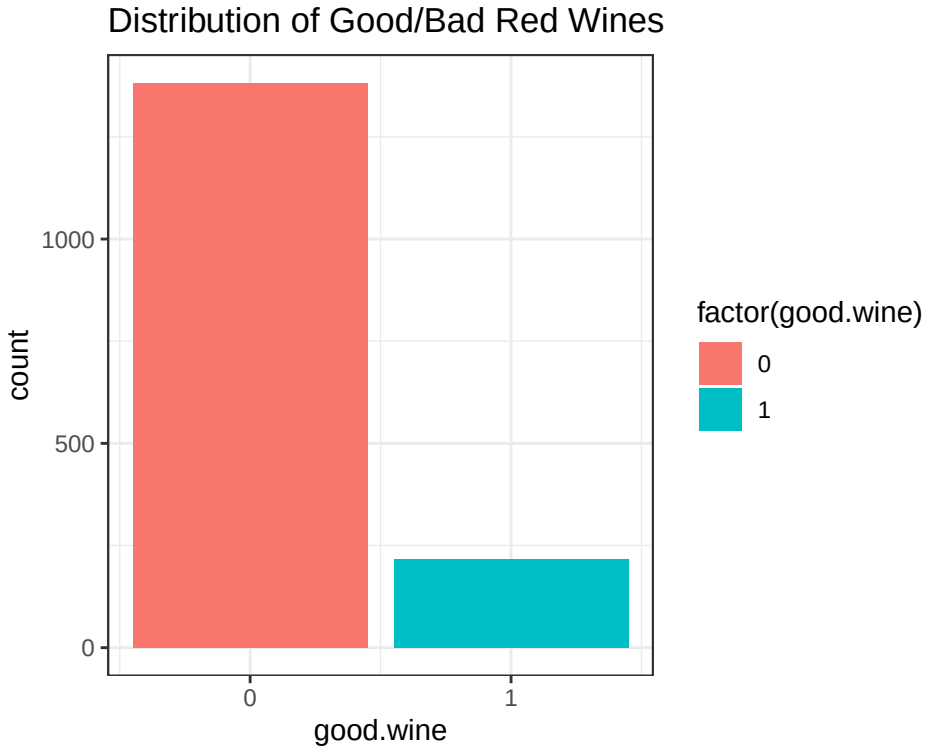


Let's see how the wine quality distributed.

```
ggplot(redwine, aes(x = quality)) + geom_bar(stat = "count",
    position = "dodge") + scale_x_continuous(breaks = seq(3,
    8, 1)) + ggtitle("Distribution of Red Wine Quality Ratings") +
    theme_bw()
```



```
ggplot(redwine, aes(x = good.wine, fill = factor(good.wine))) +
    geom_bar(stat = "count", position = "dodge") + scale_x_continuous(breaks = seq(0,
    1, 1)) + ggtitle("Distribution of Good/Bad Red Wines") +
    theme_bw()
```



Effect of physiochemical properties on the wine quality

```
ggplot(redwine, aes(x = fixed.acidity, fill = factor(good.wine))) +
    geom_density(alpha = 0.25) + geom_vline(aes(xintercept = mean(fixed.acidity[good.wine ==
    0], na.rm = T)), color = "red", linetype = "dashed", lwd = 1) +
    geom_vline(aes(xintercept = mean(fixed.acidity[good.wine ==
        1], na.rm = T)), color = "blue", linetype = "dashed",
        lwd = 1) + scale_x_continuous(breaks = seq(4, 16, 1)) +
    xlab(label = "Fixed Acidity Level") + ggtitle("Distribution of Fixed Acidity Levels") +
    theme_bw()
```

3. Predictive Modeling by Random Forest

```
redwineRF = randomForest(factor(good.wine) ~ . - quality, redwine,
    ntree = 200)
redwineRF
```

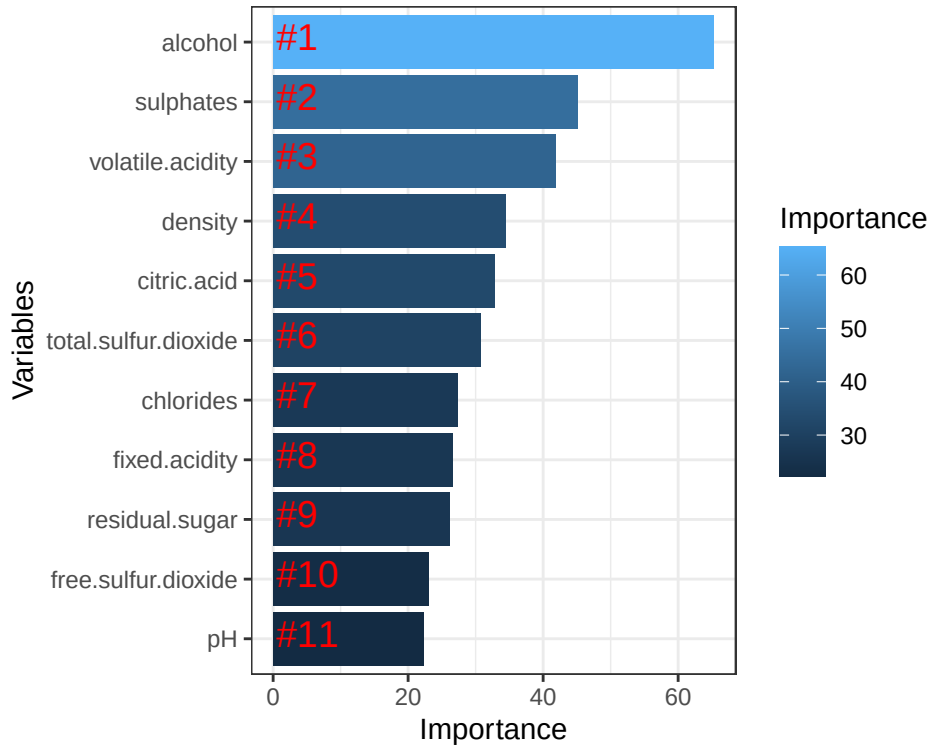
3.1 Model Fit

```
##
## Call:
##  randomForest(formula = factor(good.wine) ~ . - quality, data = redwine,      ntree = 200)
##                Type of random forest: classification
##                      Number of trees: 200
## No. of variables tried at each split: 3
##
##         OOB estimate of  error rate: 8.19%
## Confusion matrix:
##      0   1 class.error
## 0 1345  37  0.02677279
## 1   94 123  0.43317972
```

The classification accuracy reach to ~92%.

3.2 Variable Importance

```
importance = importance(redwineRF)
varImportance = data.frame(Variables = row.names(importance),
    Importance = round(importance[, "MeanDecreaseGini"], 2))
rankImportance = varImportance %>% mutate(Rank = paste0("#",
    dense_rank(desc(Importance))))
ggplot(rankImportance, aes(x = reorder(Variables, Importance),
    y = Importance, fill = Importance)) + geom_bar(stat = "identity") +
    geom_text(aes(x = Variables, y = 0.5, label = Rank), hjust = 0,
        vjust = 0.3, size = 5, colour = "red") + labs(x = "Variables") +
    coord_flip() + theme_bw()
```



The alcohol has the highest importance among the features, which is consistent with the density plot observation.
